Help

The Adobe Acrobat Search command is more powerful and flexible than the Find command. You can search across multiple documents and define advanced query criteria. Search is faster than the Find command because it reads an index rather than an entire document.

Displaying the Search window

You can search for a simple word or phrase, or you can expand your search query by using Boolean operators. You can use the search options to further refine your search.

Do one of the following:

- Choose **Edit** > **Advanced Search** (Shift+Ctrl+F).
- On the **Find** toolbar, click the arrow and choose **Open Full Acrobat Search**. To display the Find toolbar, choose **Edit** > **Find** (Ctrl+F).

The **Search** window appears as a separate window that you can move, resize, minimize, or arrange partially or completely behind this PDF window.

In the **Search** window, click **Arrange Windows** to automatically arrange Adobe Reader windows (such as document windows and the Search window) to not overlap.

Advanced search options

By default, the **Search** window displays basic search options. Click **Show More Options** near the bottom of the window to display advanced search options. To restore basic search options, click **Show Less Options** near the bottom of the window.

In the Adobe Acrobat preferences, you can set the "more search options" to always appear by default in the **Search** window.

More information

For more information about how to use the Search options, see the Adobe Reader help, and locate the "Searching and indexing" topics.

## Additional help topics

- Searching two or more PDF collections

Purpose	Planning & Design	Installation & Upgrades	Configuration	Operations	System Administration	Reference	Troubleshooting & Maintenance

Additional Help

Searching two or more PDF collections

The default behavior for Adobe Reader is to search the index of the displayed PDF collection. If you want to search multiple PDF collections, such as the *Experion System Documentation PDF Collection* and the *SCN, Installation, and Migration PDF Collection*, you will need to configure an index selection.
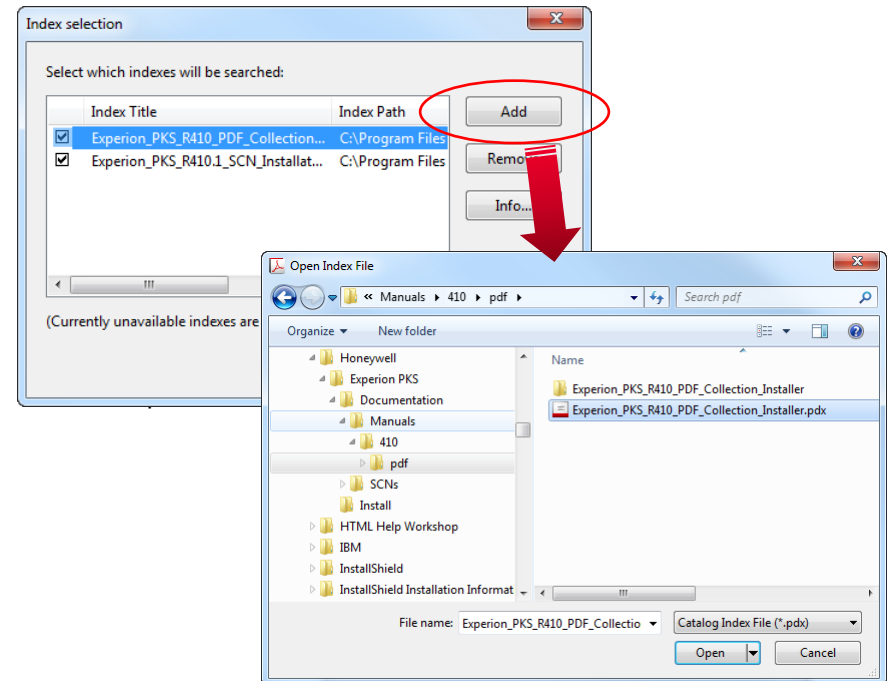

Step 1 – Open the Index selection

1. Open the **Search** window with the **Show More Options** displayed.

2. In the **Look In** list, click **Select Index**.

Searches using the selected indexes

1. Open the **Search** window with the **Show More Options** displayed.
2. In the **Look In** list, click **Currently Selected Indexes**.

3. Enter the remaining search criteria, as required.
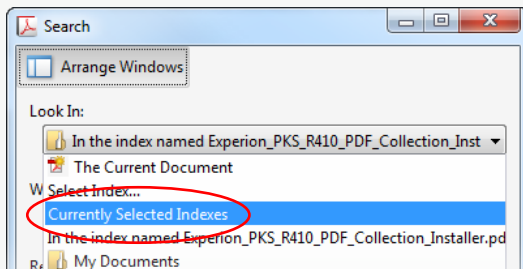

Step 2 – Select the indexes

In the **Index selection** window, add the index file (.pdx) for each PDF Collection (and remove indexes not required).

Example .pdx location: *C:\Program Files (x86)\Honeywell\Experion PKS\Documentation\Manuals\410\pdf*
